Q. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

```
# Filter count data where you have 0 read count across all samples.
countData = countData[rowSums(countData != 0) > 0, ]
head(countData)
```

Running DESeq2

Setting up the DESeqDataSet object required for the DESeq() function:

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

```
dds = DESeq(dds)

estimating size factors

estimating dispersions

gene-wise dispersion estimates

mean-dispersion relationship

final dispersion estimates

fitting model and testing
```

dds

class: DESeqDataSet

dim: 15975 6

metadata(1): version

assays(4): counts mu H cooks

rownames(15975): ENSG00000279457 ENSG00000187634 ... ENSG00000276345

ENSG00000271254

rowData names(22): baseMean baseVar ... deviance maxCooks colnames(6): SRR493366 SRR493367 ... SRR493370 SRR493371

colData names(2): condition sizeFactor

Retrieving results for the HoxA1 knockdown versus control siRNA:

```
res = results(dds, contrast=c("condition", "hoxa1_kd", "control_sirna"))
```

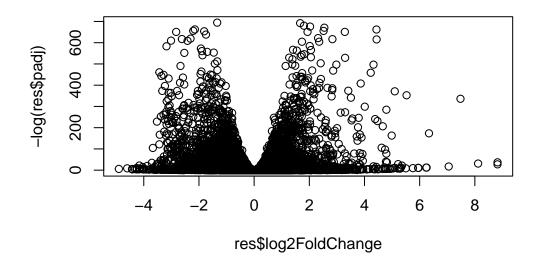

Q. Call the summary() function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

```
summary(res)
```

```
out of 15975 with nonzero total read count
adjusted p-value < 0.1
LFC > 0 (up) : 4349, 27%
LFC < 0 (down) : 4396, 28%
outliers [1] : 0, 0%
low counts [2] : 1237, 7.7%
(mean count < 0)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results</pre>
```

Volcano plot

```
plot( res$log2FoldChange, -log(res$padj) )
```

Q. Improve this plot by completing the below code, which adds color and axis labels.

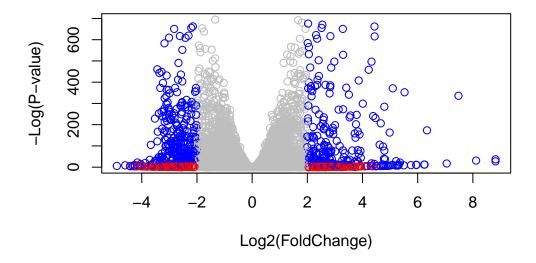

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01

# and absolute fold change more than 2
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(</pre>
```

Adding gene annotation

Since we mapped and counted against the Ensembl annotation, our results only have information about Ensembl gene IDs. However, our pathway analysis downstream will use KEGG pathways, and genes in KEGG pathways are annotated with Entrez gene IDs.

Q. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

```
columns(org.Hs.eg.db)
```

[1]	"ACCNUM"	"ALIAS"	"ENSEMBL"	"ENSEMBLPROT"	"ENSEMBLTRANS"
[6]	"ENTREZID"	"ENZYME"	"EVIDENCE"	"EVIDENCEALL"	"GENENAME"
[11]	"GENETYPE"	"GO"	"GOALL"	"IPI"	"MAP"
[16]	"OMIM"	"ONTOLOGY"	"ONTOLOGYALL"	"PATH"	"PFAM"
[21]	"PMID"	"PROSITE"	"REFSEQ"	"SYMBOL"	"UCSCKG"

'select()' returned 1:many mapping between keys and columns

'select()' returned 1:many mapping between keys and columns

```
head(res, 10)
```

log2 fold change (MLE): condition hoxa1_kd vs control_sirna

```

Q. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file="deseq_results.csv")
```

Section 2. Pathway Analysis

KEGG pathways

Loading the packages and setting up the KEGG data-sets we need.

```
library(pathview)
```

Pathview is an open source software package distributed under GNU General Public License version 3 (GPLv3). Details of GPLv3 is available at http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to formally cite the original Pathview paper (not just mention it) in publications or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG license agreement (details at http://www.kegg.jp/kegg/legal.html).

```
library(gage)
```

```
library(gageData)
  data(kegg.sets.hs)
  data(sigmet.idx.hs)
  # Focus on signaling and metabolic pathways only
  kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]
  # Examine the first 3 pathways

```

Trying out the pathview() function from the pathview package to make a pathway plot with our RNA-Seq expression results shown in color:

```
pathview(gene.data=foldchanges, pathway.id="hsa04110")
```

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14

Info: Writing image file hsa04110.pathview.png

We can play with the other input arguments to pathview() to change the display in various ways including generating a PDF graph. For example:

```
# A different PDF based output of the same data pathview(gene.data=foldchanges, pathway.id="hsa04110", kegg.native=FALSE)
```

'select()' returned 1:1 mapping between keys and columns

Warning: reconcile groups sharing member nodes!

```
[,1] [,2]
[1,] "9" "300"
[2,] "9" "306"
```

Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14

Info: Writing image file hsa04110.pathview.pdf

Processing our results a bit more to automagically pull out the top 5 upregulated pathways, then further process that just to get the pathway IDs needed by the pathwiew() function. We'll use these KEGG pathway IDs for pathwiew plotting below.

```
# Focus on top 5 upregulated pathways here for demo purposes only
  keggrespathways <- rownames(keggres$greater)[1:5]</pre>
  # Extract the 8 character long IDs part of each string
  keggresids = substr(keggrespathways, start=1, stop=8)
  keggresids
[1] "hsa04640" "hsa04630" "hsa00140" "hsa04142" "hsa04330"
Plots for all the top 5 pathways:
  pathview(gene.data=foldchanges, pathway.id=keggresids, species="hsa")
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
Info: Writing image file hsa04640.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
Info: Writing image file hsa04630.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
Info: Writing image file hsa00140.pathview.png
```

```
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
Info: Writing image file hsa04142.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
Info: Writing image file hsa04330.pathview.png
Q. Can you do the same procedure as above to plot the pathview figures for the top 5 down-
reguled pathways?
  # Focus on the top 5 down-regulated pathways
  keggresdownpathways <- rownames(keggres$less)[1:5]</pre>
  # Extract the 8 character long IDs part of each string
  keggresdownids <- substr(keggresdownpathways, start = 1, stop = 8)</pre>
  keggresdownids
[1] "hsa04110" "hsa03030" "hsa03013" "hsa03440" "hsa04114"
  # Plot the pathview figures for the top 5 down-regulated pathways
  pathview(gene.data = foldchanges, pathway.id = keggresdownids, species = "hsa")
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
Info: Writing image file hsa04110.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
```

```
Info: Writing image file hsa03030.pathview.png

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14

Info: Writing image file hsa03013.pathview.png

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14

Info: Writing image file hsa03440.pathview.png

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14

Info: Working in directory /Users/melissaguereca/Desktop/BIMM 143/class14
```

Section 3. Gene Ontology (GO)

We can also do a similar procedure with gene ontology.

```
data(go.sets.hs)
data(go.subs.hs)

# Focus on Biological Process subset of GO
gobpsets = go.sets.hs[go.subs.hs$BP]

gobpres = gage(foldchanges, gsets=gobpsets, same.dir=TRUE)

lapply(gobpres, head)
```

Section 4. Reactome Analysis

Let's now conduct over-representation enrichment analysis and pathway-topology analysis with Reactome using the previous list of significant genes generated from our differential expression results above.

Output the list of significant genes at the 0.05 level as a plain text file:

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))
[1] "Total number of significant genes: 8147"</pre>
```

```
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quo
```

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The Cell Cycle has the most significant "Entities p-value". The most significant pathways listed do match some of the previous KEGG results, there are a few different pathways. These differences may be due to the different databases being used or the method in which the significance is assessed.
